How we make our Shelby Cobras

3D Scanning

Using the latest 3D modelling techniques, we laser scan every detail of Carroll Shelby's original creation to produce a highly detailed computer-generated graphic representation.

Moulding

The 3D images capture every single component of the car, and are then used to create a series of over 100 individual moulds from which the model parts are formed. The moulds are made from solid steel, some of which weigh over 1 tonne, and can measure over 1m³ (35ft³). Each mould is inspected by hand to ensure the resulting parts maintain the original detailing of the initial laser scan. An alloy metal known as 'zamak' is used for casting to give the desired combination of light weight, durability, and fine detailing.

Painting

Once the parts have been formed they are sprayed in the precise 1965 Shelby Cobra Competition colours: Guardsman Blue with Wimbledon White Le Mans stripes. Tiny details, such as the numbers on the gear lever are applied by hand using intricate stencils.

Production

Our scanning and design process will usually take up to six months. After a further four months of engineering for each mould, the final parts are ready to be produced in our state-of-the-art factory. All stages of the design and production are carefully vetted and approved by Shelby American, Inc., and our expert team here at Agora Models.
